CO₂ Incubator Temperature Control: What Is the Best Place For Your Cell Culture Vessels?

Executive Summary

Does it make a difference if cell cultures are incubated on the top shelf in the incubator or on the bottom shelf? Well, it certainly should not! But depending on the incubator you are using, it may not be a good idea to put sensitive cells near a circulating fan. Even if your incubator does not have a fan causing vibrations or increased evaporation of the culture medium, the incubator should provide a homogeneous temperature distribution throughout the complete chamber.

A CO₂ incubator is the safe haven for your cells providing optimal atmospheric conditions. Sensitive primary or stem cells are especially susceptible to temperature increases and will react in adverse ways. When you are planning a complex experiment, or use the cells for a certain application, you want to be sure that the location of the culture vessel inside the incubator has no impact on the cells and experimental result. Just imagine if the temperature on the upper shelf is 37.5°C while it is 36.5°C on the lowest shelf.

Temperature homogeneity in CO₂ incubators (according to German DIN 12880:2007-05 norm)

In CellXpert® CO₂ incubators, the temperature homogeneity, or the spatial temperature deviation, was verified based on a test method that is defined in a German standard for ovens and incubators (DIN 12880:2007-05). In this test, a set-up with not less than 27 temperature probes is used for measuring the temperature at different locations inside the incubator (Figure 1).
The results of the test according to the standard DIN12880:2007-05 proved that CellXpert CO₂ incubators provide a reliable and homogeneous temperature distribution throughout the complete chamber. Applying the same 27-point temperature measurement to other incubators revealed much higher variations in temperature depending on the location in the incubator (Figure 2).

Taken together, your cells are exposed to the same stable atmospheric conditions in CellXpert CO₂ incubators no matter where the culture vessels are located.

Does 1 °C difference matter?

**Example: Effects on induced pluripotent stem cells (iPSCs)**

One example is the atypical morphology developed by human iPS cells grown at 38 °C compared to optimal temperature of 37 °C (Figure 3). But even if you set the temperature to the 37 °C desired in most cases, not all incubators provide uniform spatial distribution of temperature. So, placing the culture vessels on different shelves or different positions on the shelf can make a difference depending on the incubator you are using.

---

**Fig. 3:** Human induced pluripotent stem cells incubated to illustrate differences in morphology. Appearance of atypical cell morphology highlighted in pink. hiPS cell incubated at 37° (A) predominantly show typical morphology of high nuclear-to-cytoplasm ratio, prominent nucleolus and densely packed colonies. Incubation at 38 °C (B) increases the appearance of less densely packed and more shiny cell colonies with less pronounced nucleoli.
The technology behind – multiple sensors, individually controlled heating circuits, and no fan

Most incubators are equipped with one temperature probe mounted on the back wall of the inner chamber. Thus, temperature is measured locally at one spot inside the incubator. A second temperature probe is often included to avoid harmful over-temperature, but not to control for spatial homogeneity. A quick recovery of temperature and gas levels after door opening is often achieved by an internal fan. This fan-assisted heating technology leads to a forced airflow inside the incubator which may cause multiple issues, like spreading of air-borne contaminants, vibration on the shelves, and evaporation of the culture medium.

CellXpert CO₂ incubator offer three-dimensional regulation of the temperature achieved by several sensors placed directly at the different heating circuits surrounding the chamber and the door. This 3D temperature control and the direct heating technology result in highly uniform temperature distribution throughout the whole incubator. In addition, the temperature control system leads to quick temperature recovery after door opening (under 5 min without temperature overshoot). Thus, CellXpert CO₂ incubators provide optimal conditions for cell cultures independent from their location on the shelves.

About Eppendorf

Eppendorf is a leading life science company that develops and sells instruments, consumables, and services for liquid-, sample-, and cell handling in laboratories worldwide. Its product range includes pipettes and automated pipetting systems, dispensers, centrifuges, mixers, spectrometers, and DNA amplification equipment as well as ultra-low temperature freezers, fermentors, bioreactors, CO₂ incubators, shakers, and cell manipulation systems. Consumables such as pipette tips, test tubes, microtiter plates, and single-use bioreactora vessels complement the range of highest-quality premium products.

Eppendorf was founded in Hamburg, Germany in 1945 and has more than 3,300 employees worldwide. The company has subsidiaries in 26 countries and is represented in all other markets by distributors.
