How to Keep Your Electronic Pipette in Good Condition

Maintenance tips
Battery care
All rechargeable batteries are wear components and their performance decreases with chemical age. Here are some tips to maintain a good battery life:

Using the pipette for the first time: The full battery capacity will be reached after a few recharging cycles

Storing the pipette when not in use for more than a month:
> Charge fully
> Unplug the battery
> Recharge every other month

Replace the battery after three years of use

Using the pipette: Avoid extreme ambient temperatures

Storing the pipette: We recommend to store the pipette in a charging stand

General maintenance & cleaning
Regular (daily) decontamination and cleaning is very similar to mechanical pipettes. The two key watch-outs to keep your electronic pipette in good shape are:

Wipe the pipette with disinfectant – don’t spray it

Autoclave lower part only
