# Your Normalization – Effortless!

#### Normalization in a single command

The enhanced feature set 2 implements one of the most requested features from epMotion® users: An improved normalization feature in epBlue. Instead of using csv-import, normalization will become a single command. And the best part, it is not only as precise as manual or csv-based normalization, but it is also even faster than both other options!

- > No third-party program needed
- > Drag and drop normalize commands in your method
- > Automatic normalization calculation, no spreadsheets needed
- > Adjust parameters before the run without changing the method
- > Results can be exported for effortless documentation

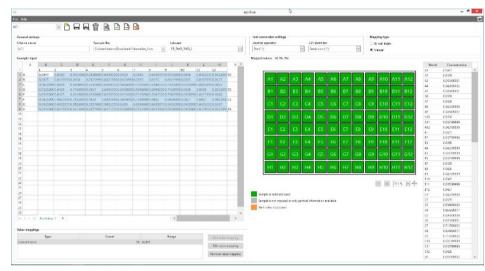

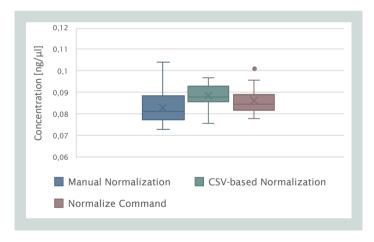

### Your Normalization Now Faster and Easier

The new data layout editor is easy to use and allows handling data sets directly coming from your plate reader.

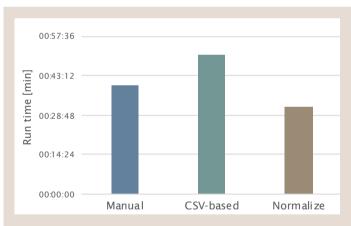

### Same Performance...

Normalization of human gDNA present in a 96-well plate at 8 concentrations in triplicates (24 wells) to a target value of 0,1 ng/ $\mu$ l. Measurement of the gDNA concentrations in the destination plate by fluorometric quantification. Fluorometric method results in ~10% lower concentration measurements systematically.

### **Shorter Runtimes!**

Processing time comparison for the normalization of 96 samples using water. Transfer from source 96 well plate to target 96 well plate. Diluent is presented in a reservoir.
