English (EN)
1 Operating instructions
1.1 Using this manual

- Read this operating manual completely before using the device for the first time. Also observe the instructions for use of the accessories.
- This operating manual is part of the product. Thus, it must always be easily accessible.
- Enclose this operating manual when transferring the device to third parties.
- You will find the current version of the operating manual for all available languages on our website www.eppendorf.com.

2 Safety

2.1 User profile

The device may only be operated by trained lab personnel who have carefully read the operating manual and are familiar with the device functions.

2.2 Safety precautions

Before operating the shaker, verify that anyone involved with its operation has been instructed in both general safety practices for laboratories and specific safety practices for this apparatus.

- The user is also responsible for following local guidelines for handling hazardous waste and biohazardous materials that may be generated from the use of this equipment.

It is the responsibility of the user to carry out appropriate decontamination procedures if hazardous material is spilled on or inside the equipment. Before using any cleaning or decontamination method other than those suggested by the manufacturer, users should check with Eppendorf that the proposed method would not damage the equipment.

This equipment is not explosion-proof, and should never be used with flammable substances or used to grow organisms that produce flammable by-products.

**WARNING! Risk of explosion and injury or death!**

- Do not use equipment with flammable substances or organisms with flammable by-products.

**NOTICE! Damage to device!**

- Never run shaker without a platform.

**DANGER! Explosion hazard**

- Do not operate the device in areas where work is completed with explosive substances.
- Do not use this device to process any explosive or highly reactive substances.
- Do not use this device to process any substances which could create an explosive atmosphere.

**CAUTION! Lack of safety due to incorrect use of materials**

- Do not use this device to process any flammable materials, or use materials where the transfer of mechanical energy to glass apparatus could lead to breakage.
Due to its design and the ambient conditions in its interior, the device is not suitable for use in potentially explosive atmospheres.

The use of substances which may contribute to a potentially explosive atmosphere is not permitted.

The final decision regarding the risks associated with using these types of substances is the user’s responsibility.

2.3 Warnings for intended use

**WARNING! Heavy!**
- Do not attempt to lift the New Brunswick I26/26R by yourself.
- Ask for assistance or use suitable equipment when raising or handling the device.

**WARNING! Risk of electric shock and/or damage to unit!**
- Check that the voltage and frequency of your unit are compatible with mains/power supply.
- Remove caution label from back of unit.
- Set the circuit breaker on the right side of the unit to the OFF position.

**WARNING! Risk of electric shock and/or damage to device!**
- Use a grounded power supply.

**WARNING! Risk of electric shock and/or damage to the device!**
- Before cleaning device, turn off and unplug from mains/power supply.

**WARNING! Risk of electric shock when replacing fuses!**
- Turn off shaker and disconnect from mains/power supply.

**WARNING! Injury from hazardous biological material!**
- Use respiratory protection when cleaning spills where aerosolization is suspected.
- Wear gloves, safety glasses, and laboratory coat when cleaning.

**NOTICE! Damage to device!**
- Never run shaker without a platform.
3 Product description
3.1 Front view

Fig. 3-1: Front view

1 User interface
   Display, indicator lights and keypad
2 On/Off switch
3 Platform rests
4 Door is open
3.2 Shaking speed control

The shaking mechanism is a triple eccentric bearing housing. The bearing housing is driven by a low voltage brushless DC motor and a multi-V belt and pulley reduction system. The approximate speed reduction is as follows:

- 4:1 for 1 in stroke housings
- 4.5:1 for both ¾ in and 1 in stroke housings

The hall sensors in the motor are used for both electronic commutation and speed feedback. A programmable logic device on the board performs the electronic commutation logic and extracts a tachometer signal from the hall sensor status. The hall sensor signals are filtered via analog means to reduce noise induced by the switching circuits, and the programmable logic employs an intelligent digital filter to reject hall sensor edge bounce.

The microprocessor:

- Converts the tachometer signal to speed feedback
- Performs a Proportional and Integral (PI) control algorithm
- Outputs a Pulse Width Modulation (PWM) signal to control the power level applied to the brushless motor

The power applied to the motor is limited in 2 ways for safety:

1. The high side Field Effect Transistor (FET) driver includes a current sensing mechanism and logic to turn the FET’s off when the preset current limit is exceeded.
   The microprocessor is programmed to limit the PWM command to the motor based on the actual speed. This provides a “soft-start” feature and a secondary software current limiting function.

A magnetic pickup or an InfaRed (IR) sensor is provided to count the actual number of revolutions of the counterweight in the shaking mechanism. This is only used during the auto-calibration phase to determine the exact drive belt reduction ratio. During the calibration phase the shaker runs at approximately 280 rpm for 4 min and should not be interrupted. When calibration is complete, the shaker automatically returns to normal operation and stores the new calibration value in non-volatile memory.
3.3 Temperature control

The chamber temperature is sensed by a 1000 ohm platinum RTD. The RTD signal conditioning circuitry and A/D frequency converter are contained on the main control PCB board. A 16 bit zero-based A/D system is used, resulting in a useful resolution of about 1 part in 20000 °C or 0.00625 °C. A very low temperature coefficient (0.01 %) resistor provides the reference.

Each Resistance Temperature Detector (RTD) assembly is fitted with a calibration resistor selected at the time of calibration. The calibration method is the same as for previous shakers so that all shaker RTDs are interchangeable.

The New Brunswick I26/26R Shaker uses a second channel on the A/D frequency converter to measure the value of the calibration resistor, calibrated to National Institute of Standards and Technology (NIST) traceable standard.

The microprocessor reads the resistance values of the RTD and the calibration resistor, then it calculates the chamber temperature. The microprocessor then implements a PI control algorithm to close the temperature loop. A 650 W heater is PWM controlled on a 2.5 s duty cycle. This cycle time is fast enough to prevent noticeable changes in air temperature due to the cycling, and slow enough to achieve a 1 part in 250 output resolution when the power switching is done by a zero voltage switching SSR. The SSR resides on the power distribution PCB board (M1324-7011).

3.4 Operator interface

The operator interface consists of:

- 240 cm (94.48 in) x 128 cm (50.39 in) graphic LCD display
- START/STOP key
- ▲ ▼ keys
- SELECT key

All of these components are interfaced to the display control PCB board (M1324-7002), which has its own microprocessor programmed to provide the user interface functions.

The display board communicates with the main control board via synchronous serial link running at about 380 kHz. The main control board is the master of the link, with the display board accepting information updates from and sending back operator changes to the main board. The LCD display is backlit with a cold cathode fluorescent lamp. The display control PCB board contains the DC to AC inverter that generates approximately 1000 VAC for the CCF lamp.
3.4.1 Keypad

1 Status indicators
   (see Status indicators on p. 15)

2 Display
   (see LED display on p. 14)

3 Function indicators
   (see Function indicators on p. 15)

4 User interface keys
   (see User interface keys on p. 15)

3.4.2 LED display

The digital display on the control panel is a three-digit LED display. During normal shaker operation, the display indicates:

- Shaker status (On/Off)
- Shaking speed
- Chamber temperature
- Setpoints
- Hours remaining (in a timed run)
- Door (“Lid”) open

If the shaker enters into an unstable operating condition (e.g., unbalanced load causing excess vibration and unlevel floor), the warning message “tLt” appears in the LED display and the tilt switch shuts off the shaker.
3.4.3 User interface keys

Tab. 3-1: User interface keys

<table>
<thead>
<tr>
<th>Key</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>START/STOP</strong></td>
<td>• Used to start or stop the shaker  &lt;br&gt;• Activates or stops the timer when a timed run is desired</td>
</tr>
<tr>
<td><strong>SELECT</strong></td>
<td>• Used to change the displayed parameter</td>
</tr>
<tr>
<td><strong>▲ ▼</strong></td>
<td>• Used to adjust the setpoint of a displayed parameter up or down &lt;br&gt;• Allows the user to enter the SET mode for setpoint changes</td>
</tr>
</tbody>
</table>

3.4.4 Status indicators

Four status indicator lights are located to the left of the LED display. They are:

Tab. 3-2: Status indicators

<table>
<thead>
<tr>
<th>Indicator</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>SET</strong></td>
<td>• Indicates that the shaker is in the SET mode, when setpoints are being displayed and can be altered &lt;br&gt;• Activated by the SELECT key or by pressing the ▲ or ▼ key</td>
</tr>
<tr>
<td><strong>POWER</strong></td>
<td>• Illuminates and blinks during power up or if power is interrupted during a run &lt;br&gt;• To turn off this indicator, press the SELECT key and change to another function</td>
</tr>
<tr>
<td><strong>HEAT</strong></td>
<td>• Illuminates to indicate that the heater is on</td>
</tr>
<tr>
<td><strong>TIME</strong></td>
<td>• Indicates that the timer is in operation &lt;br&gt;• The shaker can be programmed to run for a preset time from 0.1 h – 99.9 h &lt;br&gt;• The timer can be disengaged without stopping an ongoing run</td>
</tr>
</tbody>
</table>

Tab. 3-3: Function indicators

<table>
<thead>
<tr>
<th>Symbol</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>°C</td>
<td>• Interior chamber temperature &lt;br&gt;Can be set from 4 °C – 60 °C when in SET mode, using the ▲ or ▼ key &lt;br&gt;Indexes at 0.1 °C increments unless the key is pressed for 4 s, after which it indexes in 1 °C increments</td>
</tr>
</tbody>
</table>
3.5 Power failure

In the event of a mains/power failure, the New Brunswick™ I26/26R Shaker is equipped with an automatic restart function. If the shaker was in operation at the time of the mains/power failure, the shaker begins to operate at its last setpoint. The LED display flashes, indicating that a power failure has occurred. To stop the flashing of the LED display, press any key.
4 Installation

4.1 Inspection of boxes

After you receive your order from Eppendorf, inspect the boxes carefully for any damage that may have occurred during shipping. Report any damage immediately to the carrier and to your local Eppendorf Customer Service Department.

4.2 Packing list verification

Verify against your Eppendorf packing list that you have received all of the correct materials.

4.3 Unpacking equipment

WARNING! Heavy!

- Do not attempt to lift the New Brunswick I26/26R Shaker by yourself.
- Ask for assistance or use suitable equipment when raising or handling the device.

To unpack the New Brunswick I26/26R Shaker, you need the following:

- Hammer
- Forklift or other lifting equipment to lift 168 kg (370 lb) or more
- Shears to cut 12.7 mm (½ in) wide plastic strapping
- Tool to remove 7.6 cm (3 in) metal staples

4.4 Physical location

The unit must be situated in an area where there is sufficient space for the shaker and platform to clear walls and obstructions during operation. The surface on which the unit is placed must be smooth, level, and able to support the shaker under full load operating conditions.

WARNING! Risk of injury!

- Do not attempt to lift the shaker by hand. Always use a lifter or other suitable equipment when raising or handling the unit.
4.4.1 Space requirements

Be sure to allow 10 cm (4 in) around the shaker for proper ventilation, and 61 cm (24 in) on the right side for service access to fan and refrigeration assemblies.

<table>

</tr>
</tbody>
</table>

4.5 Tools required for installation

To install the New Brunswick I26/26R Shaker on an optional base, or to stack I26/26R units, the following tools are needed:

- Number 2 Phillips® head screwdriver
- Level, around 25.4 cm (10 in)
- 2 adjustable wrenches
- Forklift or other lifting equipment to lift more than 168 kg (370 lb)
- Metal leveling shims
4.6 Leveling a single shaker

Fig. 4-1: Adjustable foot

1 Bottom of unit 3 Foot
2 Flats for wrench 4 Lock nut

Make sure that the shaker is placed on a level surface and that all 4 feet are solidly on the surface. If the shaker is not level, adjust the feet as needed to achieve leveling:

1. To keep the threaded stud from falling out, immobilize the top lock nut against the unit with one wrench when you adjust the foot.
2. With a second wrench against the flats of the threaded stud, just above the foot: rotate clockwise to lower the foot or counter-clockwise to raise the foot.
3. Place a level on the top of the unit.
4. If necessary, make further adjustments by repeating all steps until the unit is level.
5. Fully load the shaker, and do a test run at normal speed. Make additional leveling adjustments if necessary.

The maximum foot height adjustment is ~ 6.4 mm (¼ in). If a higher adjustment is required, you need to add metal shims.
4.7 Adding a base

There are 3 bases available for the New Brunswick I26/26R Shaker. The height of the base depends on whether you are installing one unit on the base, or stacking 2 or 3 units:

Tab. 4-2: Bases

<table>
<thead>
<tr>
<th>Number of shakers</th>
<th>Base height</th>
</tr>
</thead>
</table>
| 1                 | 43.2 cm (17 in)  
One 10.2 cm (4 in) base and one 33.0 cm (13 in) base, bolted together at the factory |
| 2 stacked         | 33.0 cm (13 in) |
| 3 stacked         | 10.2 cm (4 in) |

4.8 Preparing the optional base

1. Place the base on a sturdy (capable of bearing the weight of the combined base shakers and shaker contents), level surface, making sure that all four corners are solidly on the surface.
2. If the base is not level, place metal shims as needed under the base until it is level.
3. If you are mounting a single shaker, use the 43.2 cm (17 in) base (see Fig. 4-3 on p. 21). Bolt the shaker to the base using the hardware provided.

Fig. 4-2: Optional short base, 10.2 cm (4 in)

1 Rear corner brace
4. (see Fig. 4-2 on p. 20) and (see Fig. 4-3 on p. 21). Depending on the height of your base, install the front side braces and rear corner braces on the base with the hardware provided, matched to the holes in the base.
4.9 Mounting the New Brunswick I26/26R Shaker on the optional base

1. Using a forklift or lifter, raise the New Brunswick I26/26R Shaker so that its back end is tilted toward the rear of the base.
2. Remove all 6 feet from the bottom of the shaker. They are not needed for stacking, but you can keep them for future use.
3. With 2 assistants, each holding the shaker on one side, lower the unit onto the base, rear panel first. Slowly and gently remove the forklift or lifter and lower the front of the unit onto the base by hand.
4. Using the $\frac{1}{2}$-13 x 1 ¼ in Allen® head screws, $\frac{1}{2}$ in lock washers, and washers provided, secure the rear of the New Brunswick I26/26R Shaker to the corner braces in the base. With the remaining $\frac{1}{2}$-13 x 1 ¼ in Allen head screws, $\frac{1}{2}$ in lock washers, and washers, attach the front corner braces to the unit.

Optional handles are available to facilitate maneuvering the shaker onto the base (see Optional handles on p. 51).

5. Attach the front corner braces to the base using the two sets of $\frac{1}{2}$-13 x 1 ¼ in Allen head screws, lock washers, and washers provided, and secure.
4.10 Installing the New Brunswick™ I26/26R Shaker stacking kit

If the shaker you place on the bottom is already mounted on a 43.2 cm (17 in) base, follow these instructions first:

To stack two shakers:
1. Remove the 10.2 cm (4 in) high section of the base.
2. Remove the base mating supports.
3. Move the corner braces from the 10.2 cm (4 in) base to the 33.0 cm (13 in) base.
   Reinstall the shaker on the 33.0 cm (13 in) base.

To stack three shakers:
1. Remove the 33.0 cm (13 in) high section from the bottom of the base.
   Remove the base mating supports.

6. With the corner braces securely in place, the shaker mounted on its base looks like Fig. 4-6.
7. Make sure the shaker is level; add metal shims under the base as needed to level the unit.
8. Fully load the shaker and do a test run at normal speed. Make additional leveling adjustments if necessary.

Fig. 4-6: Braces secure
1. Remove the six ½ in plastic slotted set screws and the three ¼ in plastic socket set screws from the top of the shaker installed on the base.

2. Using the six ½-13 x 1 in hex head screws, lock washers, and washers provided, attach the stacking kit stacking rails to the top sides of the unit installed on the base. Secure the rails in place.
4.11 Stacking the New Brunswick I26/26R Shaker

1. Using a forklift or lifter, raise the shaker to be stacked so that its back end is tilted toward the rear of the mounting brackets.
2. Remove the feet from the unit. They are not needed for stacking, but you can keep them for future use.
3. With 2 assistants, each holding the unit on one side, lower the shaker onto the mounting brackets, rear panel first. Slowly and gently remove the forklift or lifter and lower the front of the unit onto the mounting brackets by hand.
4. Secure the bottom of the upper shaker the side stacking rails using the six ½-13 x 1 in screws, lock washers, and washers provided (circled in red in Fig. 4-10). Also secure the upper unit to the stop rail using three ¼-20 x 5/8 in hex head screws, lock washers, and washers.
5. As before, make sure the shakers are level; add metal shims under the base if needed.
6. Fully load the shaker and do a test run at normal speed. Make additional leveling adjustments if necessary.

4.12 Stacking a third New Brunswick I26/26R Shaker

Be sure to use the 10.2 cm (4 in) base only when you stack 3 shakers.
When stacking 3 shakers, it is imperative that all shaker loads be balanced. These shakers operate best at maximum speed with a load of 15.5 kg ± 1.4 kg (34 lb, ± 3 lb), which includes all platforms, clamps, and filled glassware (see *Load and speed graphs on p. 46*).

To stack a third shaker, repeat the procedures to install the stacking kit (see *Installing the New Brunswick I26/26R Shaker stacking kit on p. 23*), stack the shaker, and level the entire assembly.

4.13 Platform assemblies

The New Brunswick I26/26R Shaker can be used with a universal, dedicated, or Sticky Pad® platform. Universal platforms accept a variety of clamps for flasks and test tubes. Dedicated platforms are supplied with clamps already installed. Sticky Pad platforms do not have holes because they do not require clamps; the adhesive quality of the Sticky Pad or sticky tape applied to the platform holds flasks in place.

Sticky Pad and sticky tape are options that are sold separately.

A platform is a separate item, not included with the shaker assembly, but which is required for operation (see *Available platforms on p. 49*), (see *Platform installation for standard and lighter loads on p. 28*), and (see *For heavier loads on p. 29*).

4.14 Install flask clamp

If you are not using a universal platform, skip this section.

Flask clamps purchased for use with universal platforms require installation. Clamps are installed by securing the base of the clamp to the platform with the correct type and number of screws. All clamps are shipped complete with hardware.

Clamps for 2 L and 2.8 L flasks are shipped with an additional girdle to keep the flasks in place.

The use of this additional girdle keeps the flask from spinning inside the clamp. The girdle is an assembly of springs and sections of girdle tube. One girdle is already in place on the clamp, the other is packed separately.
To install these double girdle clamps:

1. Place the clamp on the platform, aligning its mounting holes with holes on the platform. Secure the clamp in place using the flat Phillips head screws provided (#S2116-3051, 10-24 x 5/16 in).

2. With the first girdle in place as delivered, insert an empty flask into the clamp.

3. After making sure the sections of tubing are located between the clamp legs, roll the first girdle down the legs of the clamp as far as it can go. The tubing sections rest against the platform, and the springs are under the clamp base.

4. Place the second girdle around the upper portion of clamp body (just as the first girdle was initially). Make sure that its spring sections rest against the clamp legs, while its girdle tube sections sit against the flask, in between the clamp legs.

   The upper girdle secures the flask within the clamp, and the bottom girdle keeps the flask from spinning.
4.15 Platform installation for standard and lighter loads

Eppendorf recommends using this platform installation procedure if you plan to operate the shaker with any load that uses flasks 1 L in volume or below.

Fig. 4-13: Platform installation – standard and lighter loads

1. To pop out both latches, press the buttons on the front of the platform.
2. Using the handle on the center front of the platform, pull it forward to rest on the door guide strips. The two stop pins in the door keep the platform from falling off the sub-platform.
3. Slide it back in and be sure to securely close the latches before operating the shaker again.
4.16 For heavier loads

If you are using heavier loads, it is recommended that you use knobs to secure the platform in place. The universal, 2 L, and 2.8 L dedicated platforms include a package containing the following parts:

- 2x P0220-9341 – KNOB, THREAD HOLE, 5/16-18, NYLON, BLK
- 2x S1224-2206 – SCREW CAP ALN 5/16-18X1-1/4BLK
- Flat Washers and lock washers

To attach the knobs onto the existing platform:

1. Remove the sub-platform and flip the sub-platform upside down.
2. Insert screw as shown (see Fig. 4-14 on p. 29).
3. Reinstall the sub-platform.

![Diagram](image)

**Fig. 4-15: Knob**

1. Knob
2. Flat washer
3. Lock washer

4. Using the side handles of the platform (see Fig. 4-16 on p. 31), place the platform on the guide strips on the flat of the open door.

5. Push the platform toward the rear of the unit, aligning the bottom of the platform with the top of the sub-platform, and making sure the sides are squared up with the sub-platform sides.

6. When the platform is fully inserted and mated to the sub-platform, install the flat washer and the lock washer as shown, and then screw the removable knob onto the screw; tighten appropriately (see Fig. 4-15 on p. 30).

7. Verify that the platform is now secured to the sub-platform and the drive.
4.17 Electrical connections

Before making electrical connections, verify that the mains/power source voltage matches the voltage on the electrical specification plate and that the on/off switch is in the off position. The electrical specification plate is located on the rear panel of the unit near the power connector.

Connect the power cord to the power connector (Universal Voltage Input Module), then connect the other end to an earth/grounded receptacle.
Fig. 4-17: Rear panel

1  Power connector
2  Electrical specification plate
3  On/Off switch
5 Operation

5.1 Starting the shaker

To initially start the shaker, close the door and turn the on/off switch on the right side panel of shaker to the on position.

When the shaker begins to operate, the LED display tracks the speed as it accelerates to the last entered setpoint. The shaking action can be started or stopped by pressing the START/STOP key on the keypad.

Fig. 5-1: On/Off switch location

3 Door handle
   Cut-out under rim

The shaker does not operate if the door is open. This is indicated by the word Lid appearing in the LED display.

5.2 Continuous/unlimited run

1. If the LED displays OFF, press the START/STOP key.
2. Press the SELECT key until RPM illuminates.
3. To enter the SET mode, press either the ▲ or ▼ key. The SET indicator illuminates.
4. Set the speed by using the ▲ or ◀ key until the desired setpoint is displayed. Holding the ▲ or ◀ key causes the setting to change more rapidly.

The setpoint can be changed at any time during a run without stopping the shaker by following Steps 2 – 4.

5.3 Checking setpoints

To check any setpoint:

1. Press the SELECT key until the desired indicator illuminates.
2. To enter the SET mode and display the current setpoint, press either the ▲ or ◀ key.
   
   Holding the ▲ or ◀ key for more than 0.5 s causes the setpoint to change. Should this occur, resetting is necessary.
5.4 Timed functions

The shaker can be programmed to automatically stop after a preset time period of 0.1 h – 99.9 h. In order to set the timer, there must be power to the shaker. However, a timed run can be initiated while the shaker is either shaking or stopped.

5.4.1 To set the timer:

1. Press the SELECT key until the HRS indicator illuminates.
2. To enter the SET mode and set the desired run time (between 0.1 h – 99.9 h), press either the ▲ or ▼ key.
   
   *If the shaker is stopped, skip to Step 5. If the shaker is already running:

3. Press the START/STOP key.
   
The shaker stops and the display reads OFF.
4. Press the START/STOP key again. The TIME indicator illuminates and the shaker starts the timed run.
   
   *If the shaker is stopped:

5. Press the START/STOP key.
   
The shaker starts the untimed mode.
6. Press the START/STOP key again.
   
The shaker stops and the display reads OFF.
7. Press the START/STOP key a third time.
   
The TIME indicator lights up and the shaker starts the timed run.

To disable the visual alarm (flashing TIME indicator), press the SELECT key and change to any other function.

To cancel the timer while the shaker is running:

1. Press the SELECT key until the HRS indicator illuminates.
2. Press the ▼ key until 0.0 is displayed, then press the START/STOP key.
   
The display reads OFF, the shaker stops, and the TIME indicator turns off.
   
   To continue in untimed mode, press the START/STOP key.

To cancel the timer while the shaker is stopped:

1. Press the ▼ key until 0.0 is displayed, then press the START/STOP key.
   
The TIME indicator illuminates and the shaker runs.
2. Press the START/STOP key again.
   
The shaker stops and the TIME indicator turns off.
3. Press the START/STOP key a third time.
   
The shaker runs in untimed mode.
5.5 Alarm functions

The New Brunswick I26/26R Shaker has an audible alarm which is activated at predetermined times.

To deactivate the audible alarm:

1. Press the SELECT key until the MUTE indicator illuminates.
2. To display ON, press the ▲ or ▼ key, then press the SELECT key.

To reactivate the audible alarm:

1. Press the SELECT key until the MUTE indicator illuminates.
2. To display OFF, press the ▲ or ▼ key, then press the SELECT key.

There is also a visual tilt alarm (see Tilt switch on p. 38).

5.6 Temperature setpoint

Press the SELECT key until the function °C indicator illuminates. The temperature can be set from 5 °C above ambient temperature to 60 °C (non-refrigerated units) or from 4 °C – 60 °C (refrigerated units). Increasing or decreasing the setpoint is accomplished with the ▲ or ▼ key.

Ambient temperature is measured 1 m from the front of the unit.

During operation, if the chamber temperature is more than 1.0 °C higher or lower than the temperature setpoint, an alarm is triggered. This alarm consists of a flashing °C indicator and audible beep. The alarm automatically deactivates as the shaker achieves the set temperature.
5.7  Temperature offset calibration

The temperature probe and the temperature controller are calibrated together at the factory. The temperature probe measures the temperature of the air at the probe’s location, near the heat exchanger return vent. The controller uses the probe input to adjust air temperature, up or down, to match the temperature setpoint.

Depending on various conditions within the chamber (e.g., flask placement and size, the heat produced by growing organisms, heat losses due to liquid evaporation from flasks), the display temperature can differ from the temperatures within the flasks.

If you wish to have the temperature display (Indicated Temperature) match the temperature at a given point, or match the average of a series of points within the chamber (Actual Temperature), proceed as follows:

1. Let the unit equilibrate at or near the desired temperature. Record the Indicated Temperature.
2. Record the Actual Temperature.
3. Calculate the temperature correction value: Actual Temperature - Indicated Temperature = Temperature Correction Value.
4. Press the SELECT key until the °C indicator illuminates.
5. Press the ▲and ▼keys simultaneously.
   The display indicates CAL.
6. Using the ▲or ▼key, enter the Temperature Correction Value calculated in Step 3.
7. To save the Temperature Correction Value to memory, press the ▲and ▼keys simultaneously.
   The °C light pulses rapidly to indicate it is not operating in the factory default mode. It pulses for a longer duration and less rapidly (with a frequency of approximately 1 s) to indicate the temperature is more than one degree above or below setpoint.
8. Press the SELECT key until the function °C indicator illuminates.
9. Press the ▲and ▼keys simultaneously.
   The display indicates CAL.
10. Using the ▲or ▼key, set the Temperature Correction Value to 0.
11. Press the ▲and ▼keys simultaneously.
    The rapid pulsing of the °C indicator stops.
5.8 Speed calibration

To calibrate the shaking speed:

1. Set the shaker to a speed that can easily be measured. If you are using a strobe, the minimum speed should be 250 rpm.
2. Compare the reading on the display to the measured reading.

If an adjustment is needed:

1. Press the SELECT key until the RPM indicator illuminates.
2. Press the ▲ and ▼ keys simultaneously.
   The display indicates CAL.
3. To change the displayed value to match the measured speed, press either the ▲ or ▼ key.
4. To save the adjustment, press the ▲ and ▼ keys simultaneously.
5. Turn the shaker off using the mains/power switch, then turn it back on.

5.9 Tilt switch

The shaker is equipped with an independent mechanical sensing tilt switch that shuts off the motor when it senses that the shaker is in an unbalanced condition, indicating tLt (“tilt”) on the LED display.

When this happens, troubleshoot the situation to restore balance, then turn the mains/power switch off. To reset the system, turn the mains/power switch on.
## Troubleshooting

7 Maintenance
7.1 Cleaning external surfaces

WARNING!

- Always turn off the shaker and disconnect the mains/power cord from the mains/power supply before performing any maintenance on the shaker.
- A detachable mains/power cord has been provided with your unit. Only use the cord provided and do not replace cord with an inadequately rated cord.

Use a cloth dampened with water or any standard, household, or laboratory cleaner to wipe down the shaker’s outer surfaces.

Never use abrasive or corrosive compounds to clean this instrument, as they may damage the shaker.

8.2 Platform capacity

Universal platforms have multiple holes enabling you to mount an assortment of flask clamps or other accessories on a single platform. The capacities shown below reflect the maximum number of flasks in a given size that fits on the platform in a balanced pattern. Universal platforms, clamps, and accessories are sold separately.

When just one size flask is used on the shaker, (i.e., 250 mL flasks), dedicated platforms come with flask clamps already mounted. Dedicated platforms generally hold a greater number of flasks than the universal platform, but do not offer the versatility.

WARNING!

- Do not use this equipment with accessories not provided or recommended by Eppendorf, or used in a manner not specified by Eppendorf and this manual. Protection provided by the equipment may be impaired, and serious injury or death can occur.

The following table shows a list of the maximum flask capacity for both dedicated and universal platforms that measure 76 cm × 46 cm (30 in × 18 in).

8.3 Load and speed graphs

These graphs show the maximum recommended speed for unstacked and stacked shakers, according to load.

In both figures, 20 % full refers to the amount of liquid in the flasks. The platforms are fully loaded with flasks.

Fig. 8-1: Load and speed for 1 unstacked shaker
8.4 Certifications

The New Brunswick I26/26R Shaker has been tested to ETL standards, to comply with UL and CAN/CSA electrical safety standards.

As attested in the CE Declaration of Conformity, the New Brunswick I26/26R Shaker also conforms to the appropriate CE standards.

9 Ordering information

9.1 Ordering accessories

When ordering accessories, provide the model number and serial number of your shaker. This information is on the electrical specification plate, located on the rear panel of the unit. The serial number is also labeled in the lower right corner of the front panel, below the chamber door seal.

![WARNING!]

- Do not use this equipment with accessories not provided or recommended by Eppendorf, or used in a manner not specified by Eppendorf and this manual. Protection provided by the equipment may be impaired, and serious injury or death can occur.

9.2 Available platforms

For dedicated platforms that measure 76 cm × 46 cm (30 in × 18 in):

<table>
<thead>

A Sticky Pad® platform (M1324-9911), eliminates the need for flask clamps. Sticky Pad® (M1250-9700) sold separately.
9.3 Replacement clamp hardware

Eppendorf flask clamps come complete with mounting screws. Additional screws are available separately (S2116-3051).

9.7 Optional handles

Each shaker has 2 threaded holes at the bottom of both side panels. You can screw the optional handles into these holes. They are useful for lifting the shaker onto an optional base, for example.

* Do not use the screw-in handles to lift the shaker if it is fastened to a base.

10 Transport, storage and disposal

10.1 Disposal

In case the product is to be disposed of, the relevant legal regulations are to be observed.

Information on the disposal of electrical and electronic devices in the European Community:

Within the European Community, the disposal of electrical devices is regulated by national regulations based on EU Directive 2012/19/EU pertaining to waste electrical and electronic equipment (WEEE).

According to these regulations, any devices supplied after August 13, 2005, in the business-to-business sphere, to which this product is assigned, may no longer be disposed of in municipal or domestic waste. To document this, they have been marked with the following identification:

Because disposal regulations may differ from one country to another within the EU, please contact your supplier if necessary.

In Germany, this is mandatory from March 23, 2006. From this date, the manufacturer has to offer a suitable method of return for all devices supplied after August 13, 2005. For all devices supplied before August 13, 2005, the last user is responsible for the correct disposal.
